1 General remarks on the seismic behaviour of structures

- 1.1 Introduction
- 1.2 Earthquake risk prevention regulations
 - 1.2.1 Earthquake zoning in France
 - 1.2.2 Importance classes
 - 1.2.3 Ground types
 - 1.2.4 Seismic action
- 1.3 Earthquake building regulations
 - 1.3.1 Rules applicable to buildings under no special risks
 - 1.3.2 Rules applicable to bridges
 - 1.3.3 Rules applicable to structures and buildings at special risk
- 1.4 Performance requirements and compliance criteria
 - 1.4.1 Definition of limit states according to EC8-3
 - 1.4.2 Reminder of ductility classes

2 Seismic retrofitting of concrete structures with FRP

- 2.1 Typical pathologies of reinforced concrete structures under seismic loading
 - 2.1.1 Shear failure
 - 2.1.2 Failure and damage under flexure with or without axial force
 - 2.1.3 Failure by the formation of plastic hinges in critical regions
 - 2.1.4 Summary
- 2.2 Retrofitting strategies
- 2.3 Contribution of composite materials
 - 2.3.1 General remarks on composite materials
 - 2.3.2 The main types of FRPs
- 2.4 Different applications of FRPs (Fibre-Reinforced Polymers)
 - 2.4.1 Shear strengthening
 - 2.4.2 Jacketing with composite materials
 - 2.4.3 Flexural strengthening
 - 2.4.4 Brief reminder of failure by detachment of FRP
 - 2.4.5 Summary and development of these solutions
- 2.5 Examples of seismic retrofitting of structures using FRP reinforcements

3 Modelling Methods for Concrete Structures

- 3.1 Constitutive law for composites
- 3.2 Definition of analysis methods
 - 3.2.1 Digital analysis methods
 - 3.2.2 Precautions to be taken when choosing a linear analysis
 - 3.2.3 Modelling methods
 - 3.2.4 Conclusion

4 Design of FRP reinforcement

- 4.1 Introduction
- 4.2 Field of application, standards, references and symbols.
 - 4.2.1 Standards and references
 - Symbols
 - N.B. blue text corresponds to changes made to the Eurocode text
- 4.3 Actions and stresses
- 4.4 Design values for properties of FRP sheets
- 4.5 Reinforcement with respect to normal force and flexure with and without axial force
 - 4.5.1 Confinement

- 4.5.2 Case of reinforcement with respect to flexure with and without axial force
- 4.6 FRP retrofitting to prevent shear failure
 - 4.6.1 Rectangular section
 - 4.6.2 Circular cross-sections
 - 4.6.3 Contribution of the composite to shear strength in the case of cyclic loading at a plastic hinge
 - 4.6.4 Calculation example 1: Squat column
 - 4.6.5 Calculation example 2: Squat slender wall
 - 4.6.6 Reliable sensitivity analyses and calibration of safety factors based on design equations

5 Detailing provisions

- 5.1 Detailing provisions for flexural strength
- 5.2 Detailing provisions for confinement
- 5.3 Detailing provisions for shear
- 5.4 Anchorage
 - 5.4.1 General
 - 5.4.2 Failure modes
 - 5.4.3 Characterisation tests
 - 5.4.4 Design proposals
 - 5.4.5 Detailing

6 Conclusions

APPENDICES

APPENDIX 1: BIBLIOGRAPHIC REFERENCES

APPENDIX 2: CASE STUDIES

APPENDIX 3: Sensitivity analyses based on design equations. Example of shear

- 6.1.1 Local sensitivity analysis
- 6.1.2 Global sensitivity analysis
- 6.1.3 Reliability sensitivity analysis
- 6.1.4 Other sensitivity studies
